Setting the Stage

A plain-language guide to the AI technologies you'll see in today's demos

#AU2026

The AI Stack

How an AI agent works and how the pieces fit together

Legend:

Large Language Models (LLMs)

What is an LLM?

A neural network trained on vast text that can:

- Understand natural language input
- Reason step-by-step over structured data
- Generate JSON, code, or prose
- Follow complex multi-step instructions

Examples:

- *Claude Fable / Opus (Anthropic)*
- *GPT-5.6 series (OpenAI)*
- *Llama (Meta)*
- *Gemini (Google)*
- *Nova (Amazon)*
- *Grok (xAI)*

What an LLM is NOT

Common misconceptions to set aside:

- Not a database – it doesn't store your files
- Not deterministic – same input $\neq$ same output
- Not always right – must be validated
- Not autonomous on its own – needs an agent/app

Think of it as a very smart reasoning engine you wire up to your data.

MCP – Model Context Protocol

The open standard that lets AI models talk to your tools and data

<https://modelcontextprotocol.io/specification/>

RAG – Retrieval Augmented Generation

RAG

Knowledge + Semantic Recall – Context Injection

Phase 1: Indexing (done ahead of time)

Phase 2: Retrieval + generation (at query time)

AI Agents

Orchestrating the work – who suggests, who calls, who decides

Popular AI Agents:

Manufacturing AI – Concept & Examples

Browser extension (Concept)

"Moxy" is a context-aware chat avatar for Fusion Manage users

Purpose

- Increase user-adoption
- Help users on "how was this again"
- Make managing data fun

Description

By creating items, updating BOMs, approving workflow steps and increasing data quality each user gains credits that can be used to personalize Moxy.

Agent LLM MCP

Autodesk Assistant (in Vault)

AI-powered assistant built directly into the Vault product

Purpose

- Guide users through workflows and new features
- Help users find important files and report on information in those files
- Automate tasks without UI

Description

AI-powered, conversational tool that uses natural language processing to help users search for data, learn software features, and perform product data management (PDM) tasks without deeply navigating menus

Agent LLM MCP

Vault MCP Server App

Connecting AI-assistants to Vault

Purpose

- Ask Vault questions in plain language – no search syntax, no menu-diving
- Chat with files, items, BOMs, folders, and change orders
- Change lifecycle states, submit jobs
- Preview 3D models and highlight components right inside the chat

Description

An MCP server that connects AI assistants – Claude, Copilot, or your own app – to Autodesk Vault. The assistant works through safe, well-defined tools; the server handles login, permissions, and validation. The AI never touches Vault directly.

MCP

IMAGiNt ACCElerate AI-Assistant

Chat functionality inside the ACCElerate web app

Purpose

- Manage Forma (ACC) accounts and projects through simple chat
- Answer questions about users, companies, and assignments instantly
- Turn multi-click admin work into one sentence

Description

A chat assistant built into the ACCElerate web app for administering Autodesk Forma. It answers questions and performs actions on projects, members, companies, assignments, issues, RFIs, and submittals – with the admin approving each action.

Agent LLM MCP

Manufacturing BOM Editor

Suggesting routings and operations for BOM conversions

Purpose

- Turn an engineering BOM into a manufacturing BOM in minutes, not hours
- Suggest routings and operations based on your ERP work centers
- Keep the engineer in control – every change is reviewed before it's saved

Description

A web app that sits between PLM (Fusion Manage) and ERP (Odoo). AI agents draft the MBOM: one plans, one grounds the plan in your knowledge and your ERP's work centers, one executes approved steps. Every proposed change appears as a color-coded diff the engineer accepts or rejects.

Agent LLM MCP RAG

Symetri ForgeFlow

Automated change impact analysis

Purpose

- Understand the impact of a change BEFORE you approve it
- Automatically trace affected items, BOMs, and where-used relations
- Summarize risk so reviewers decide faster and miss less

Description

ForgeFlow reads a change order, follows the where-used trail through items and BOMs in Fusion Manage, and produces an impact summary: which products are affected, which are released, where the risk sits. The reviewer gets the full picture in seconds – and makes the call.

Agent LLM MCP

Job Processor Cockpit MCP

Connecting AI-assistants to a Job Processor Cockpit

Purpose

- Central overview of all job processor activities
- Predictive analysis
- Live status of a job processing environment

Description

Live monitoring, alerts and KPIs for your Autodesk Vault Job Processors. See what your automation is really doing, from one machine to a whole fleet.

<https://www.coolorange.com/labs>

MCP

AI Drawing Checker (Concept)

Validating drawings against company standards inside the Vault review workflow

Purpose

- Catch drawing errors before they reach release
- Check against YOUR company standards, not generic rules
- Give reviewers redlines they can accept, edit, or dismiss

Description

When a drawing enters review in Vault, AI agents read the PDF, title block and metadata, check them against your design standards (via RAG) and your Vault data, and place redline comments for every finding – each one citing the rule it's based on. The engineer reviews every redline; nothing releases automatically.

Agent LLM MCP RAG MCP

powerGate ERP Connector for AI

Connecting AI-assistants to an ERP system

Purpose

- Ask your ERP anything – stock, prices, orders, materials – in plain language
- Update ERP records from the chat, with your approval
- Works with 20+ ERP systems through your existing powerGate server middleware

Description

The connector sits between an AI client (Claude Desktop, Copilot, and others) and your ERP system. It speaks MCP to the AI on one side and connects through your existing COOLORANGE powerGate Server to your ERP on the other.

Answer

Predict

Visualize

which is the busiest location? and what are the less busiest hours in that location?

Analyzed location metrics and converted timezone data systematically

Based on the last 30 days of data, here's what I found:

Busiest Location: Sydney (GSPL-OWS568)

Sydney is by far your busiest processor:

Location	Processor	Total Jobs	% of Total
Sydney	GSPL-OWS568	31,585	61%
San Francisco	GST-JOBSERVER01	15,485	30%
Barcelona	HK-JOBSERVER	3,689	7%
Milan	BI-A09259	710	1%

Sydney processes over twice as many jobs as San Francisco and accounts for 61% of your entire environment's workload.

Least Busy Hours (Sydney - GSPL-OWS568)

Looking at overall hourly patterns across all locations:

Hour (UTC)	Hour (CEST)	Job Count	Rank
2:00 AM	4:00 AM	276 jobs	Quietest
1:00 AM	3:00 AM	903 jobs	2nd Quietest
17:00	19:00	1,147 jobs	3rd Quietest

Maintenance Window Recommendation for Sydney:

- **Best window:** 2:00-4:00 UTC (4:00-6:00 AM local CEST time) — only 276-903 jobs/hour
- **Alternative:** 22:00-23:00 UTC (midnight-1:00 AM local) — 603-731 jobs/hour

Peak Hours Warning:

Your absolute peak is **Wednesday at 13:00 UTC** with 1,603 concurrent jobs, so you'll want to avoid any maintenance windows during:

- Wednesday 11:00-15:00 UTC (1:00-5:00 PM CEST)
- Friday across the day (16,891 total jobs that day)

Christian Gessner

DEMO

Is our job processing environment healthy right now?

Overall health of the job processing environment

Overall, yes — the environment looks healthy.

- **Processors:** all 7 of 7 online and reporting (last seen 0.2–2.4 minutes ago), availability 99.1–99.6% over the last 24h. Nothing offline or unreachable.
- **Job volume:** 4,708 jobs processed, 3.3% failure rate (155 failed) — not alarming for a 24h window.
- **Top failing job type:** `autodesk.vault.syncproperties` (46 failures), followed by various DWF/PDF creation jobs (10–19 each) — worth a look if syncproperties failures are new or concentrated on one processor, but nothing here signals a systemic outage.
- **Queue waits:** p95 worst-day is only 25 seconds — no backlog or congestion.

Nothing points to a degraded or at-risk state right now. If you want, I can dig into what's driving the `syncproperties` failures specifically, or check for anomalies compared to the prior period.

📄 🔊 🍏 🔄 just now

Write a message...

Sonnet 5 Medium

Which jobs failed most in the last 7 days, and why?

Which jobs fail most, and why

Over the last 7 days, 532 of 15,352 jobs failed (3.5% overall failure rate). Here's the breakdown:

Worst job types by failure rate:

Job type	Failed / Total	Rate
syncproperties	126 / 1030	12.2%
step.create.iam	20 / 259	7.7%
dwf.create.rvt	31 / 402	7.7%
dwf.create.rfa	16 / 240	6.7%
extractbom.inventor	14 / 246	5.7%
dwf.create.iam	65 / 2003	3.2%

syncproperties stands out both in raw count (126, the most of any type) and rate — over 1 in 8 runs fail.

Top root causes (clustered error messages):

- 1. "Sync properties not allowed on non-tip versions" — 86 occurrences, all on syncproperties. This alone accounts for majority of that job type's failures — something is triggering property sync on non-tip (historical) file versions, which Vault

AI Drawing Checker (Concept)

Validating drawings against company standards inside the Vault review workflow

Purpose

- Catch drawing errors before they reach release
- Check against YOUR company standards, not generic rules
- Give reviewers redlines they can accept, edit, or dismiss

Description

When a drawing enters review in Vault, AI agents read the PDF, title block, and metadata, check them against your design standards (via RAG) and your Vault data, and place redline comments for every finding — each one citing the rule it's based on. The engineer reviews every redline; nothing releases automatically.

AI Drawing Checker

Validating drawings against company standards inside the Vault review workflow

Two example checks

"Missing GD&T datum"

Callout has no datum reference (Std. 4.2).
→ Redline placed at the callout; engineer accepts.

"Title block revision mismatch"

Drawing rev doesn't match Vault's current rev.
→ Comment added; file routed back to WIP.

powerGate ERP Connector for AI

Connecting AI-assistants to an ERP system

Purpose

- Ask your ERP anything — stock, prices, orders, materials — in plain language
- Update ERP records from the chat, with your approval
- Works with 20+ ERP systems through your existing powerGate server middleware

Description

The connector sits between an AI client (Claude Desktop, Copilot, and others) and your ERP system. It speaks MCP to the AI on one side and connects through your existing COOLORANGE powerGate Server to your ERP on the other.

Limitations, Risks and **Best Practices**

When integrating AI into engineering systems

Deterministic Logic vs. AI Reasoning

Rule-based $\neq$ Pattern-based

Deterministic

- Rule-based:
Rules are explicitly defined
- Same input $\rightarrow$ same output
- 100% predictable
- Easy to validate
- Excellent for compliance and business rules
- “If A, then B”

Example:
Vault PDF Job

AI Reasoning

- Pattern-based:
Learns patterns from examples
- Same input may produce different outputs
- Probabilistic
- Requires human review
- Excellent for ambiguity and interpretation
- “Based on context, B is likely”

Example:
EBOM- $\rightarrow$ MBOM suggestion

Limitations

What the tech can't do

- **Non-determinism & reproducibility**
Same prompt $\neq$ same output, so AI output can't be the system of record or an audit trail on its own
- **Hallucination & confidence**
The model can produce a plausible-but-wrong BOM operation; a confidence/validation gate is mandatory
- **Context-window limits**
Large assemblies/BOMs can exceed token limits; chunking and retrieval are why RAG matters
- **Garbage in, garbage out**
Wrong or missing data in CAD files, Vault, Fusion Manage or other engineering systems will result in errors

Risks

What can go wrong in production

- **IP / data exposure** — what actually leaves your walls when you call a hosted LLM, and how to scope it
- **Security & access** — SSA/impersonation vs. 3-legged OAuth, least-privilege, exactly what data the agent can reach
- **Cost unpredictability** — agent loops and roundtrips multiply tokens fast; set budgets/caps
- **Accountability & traceability** — who signs off on an AI-approved MBOM; logging every step for QA/compliance
- **Vendor lock-in & model churn** — models change monthly; architect model-agnostic so a deprecation doesn't break you
- **Over-reliance / deskilling** — the risk of engineers rubber-stamping AI output

Best Practices

How to do it safely

- **Human-in-the-loop checkpoints** — AI proposes, engineer approves
- **Ground + cite** — RAG against trusted standards/manuals, always show sources
- **Wrap AI in deterministic guardrails** — rules/schema validation for compliance, AI for ambiguity
- **Confidence thresholds** before any auto-action
- **Local vs. hosted LLM** trade-off for sensitive data
- **Lean on industry tooling** — MCP, SDKs, governance, telemetry — and start narrow, measure, iterate

“

**AI won't replace humans. But
humans who use AI will replace
those who don't.**

Often attributed to Sam Altman, CEO of OpenAI

”

**AI isn't about replacing engineers
but about supercharging their creativity and
automating repetitive tasks**

Ask yourself:
Where can AI make a difference in
my manufacturing work?
